Inbound Flow

When goods are brought into the warehouse, the system verifies and registers the RFID tags to enable accurate and automated tracking and identification of the products within the system.

Exception Handling (Worst Case):

Case 1 – Unregistered RFID Tag:

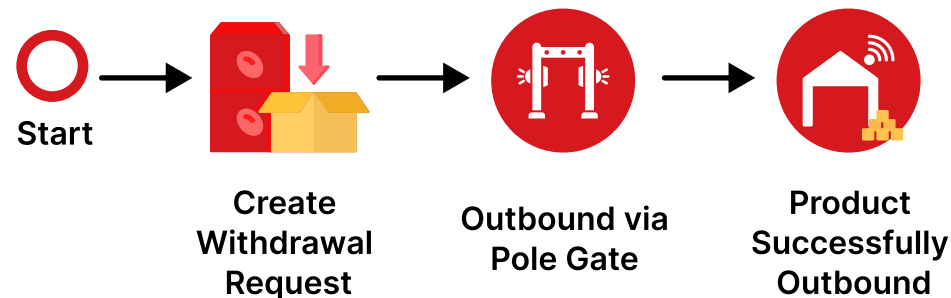

If the RFID tag has not been registered in the system, the system will display a red alert status with the message **“Unrecognized RFID Tag”** to prevent the receipt of unregistered or invalid items.

Case 2 – Unmapped RFID Tag:

If the RFID tag has been registered but has not yet been linked to a product, the system will display a yellow warning status with the message **“RFID not yet mapped to product”**, notifying the operator to complete the mapping process before proceeding with the inbound operation.

Outbound Flow

Before goods are released from the warehouse, the system verifies whether a withdrawal request has been created in the system to control product movement and prevent unauthorized outbound transactions.

Exception Handling (Worst Case):

Case 1 – No Withdrawal Request Found:

If the RFID tag passing through the Pole Gate has no corresponding withdrawal request in the system, the system will display a red alert status with the message **“RFID not authorized for outbound.”** The system will continue to issue repeated alert signals until a valid withdrawal request is created for that tag. The withdrawal transaction can be processed afterward once the request has been properly registered.
